

Blood Donor Directory

Short Project Report

Problem Statement: Develop a database-driven website to register donor name, blood group, city, demo contact and availability, and search donor records by blood group and city.

Technologies: HTML, CSS, PHP and MySQL.

Pages: index.php, config.php, save.php, view.php, search.php, update.php, delete.php and style.css.

Database: donors table with id as primary key and NOT NULL constraints.

Operations: Secure INSERT, SELECT, SEARCH/FILTER, UPDATE and DELETE.

Security: User-input SQL uses prepared statements with ? placeholders and parameter binding. Server-side validation is applied, database output uses htmlspecialchars(), credentials are stored separately in config.php, and public users are not shown detailed database errors.

Data Policy: Use dummy/sample data only. Do not enter real sensitive personal information.

InfinityFree setup: Create the MySQL database, update config.php with the hosting credentials, import database.sql using phpMyAdmin, upload the PHP/CSS files, and test the registration, search, update and delete functions.
